Every army in history has had to solve the same problem: how do you direct thousands — or hundreds of thousands — of armed people, in the noise and chaos of a battlefield, so that their violence is applied to the right targets at the right time? The answer is hierarchy. Not bureaucratic habit, not tradition for its own sake, but a functional architecture that turns an undifferentiated crowd into an instrument capable of coordinated action. This primer explains how that architecture works: what the building blocks are, how ranks map to command levels, how the modern system came to exist, and where different national and service traditions diverge.

The focus is the industrial era — roughly the Napoleonic Wars to the present — because that is when modern military organisation solidified into its familiar shape. Pre-modern armies are touched on only to show what Napoleon's innovations replaced.

1 The Logic of Military Hierarchy

The fundamental constraint on any organisation is the span of control: no human can directly manage more than roughly six to twelve subordinates and remain effective. Beyond that threshold, supervision degrades, communication breaks down, and the organisation fragments in a crisis. The solution is nesting. You group individuals into small teams, group teams into sections, sections into pla-

toons, and so on until the full army is a hierarchy of manageable spans, each layer commanded by someone who has direct authority over only the layer below.

Military hierarchies typically use multiples of three or four at each echelon. The “rule of threes” — three subordinate units per commander — is the most common. It gives a commander two manoeuvre elements and one reserve, the minimum for flexible tactics. Four is used where fire support or logistics units are added alongside the manoeuvre elements. These numbers are not sacred; they are the practical outcome of centuries of experiment.

Three terms recur throughout this primer and deserve careful definition.

Echelon means a level in the hierarchy — squad, platoon, company. All units at the same echelon share a position in the chain, regardless of their specific size or role.

Formation means an ad hoc grouping assembled for a specific mission, which may combine units from different echelons or arms. A task force is a formation; a battle group is a formation. Formations dissolve when the mission ends.

Appointment is the job someone is given; **rank** is the grade they hold permanently. A lieutenant colonel commands a battalion by appointment; if that appointment ends, they are still a lieutenant colonel. These can diverge significantly, especially in wartime when experience outpaces the promotion cycle. Understanding the distinction prevents confusion when, for example, a general officer is found commanding a force smaller than their rank would suggest.

2 The Building Blocks: From Fire Team to Battalion

2.1 Fire Team and Squad

The smallest tactical unit in most Western armies is the **fire team**: four soldiers organised around a single weapon system (in the US Army, the M249 light machine gun or the automatic rifle). A fire team has a team leader — typically a Corporal or Specialist — and three other soldiers with distinct roles: automatic

rifleman, grenadier, and rifleman. The team is small enough for a single person to lead without any formal command structure; it functions on direct instruction and personal example.

Two fire teams and a squad leader form a **squad** of nine (US Army) or eight to twelve (other armies). In the British Army the equivalent is called a **section**, and the distinction is not merely terminological — the British section is typically led by a Corporal (NATO code OR-4), while the US squad leader is a Staff Sergeant (OR-6), reflecting different views on how much leadership experience the smallest unit requires. The squad or section is the basic manoeuvre element in infantry combat; it can fight independently for short periods but cannot sustain itself logistically.

2.2 Platoon

Three or four squads plus a small headquarters form a **platoon** of 26 to 44 soldiers. In the US Army a platoon is commanded by a Second Lieutenant (OF-1), the most junior officer grade, advised by a Sergeant First Class (OR-7) serving as Platoon Sergeant. In the British Army the Platoon Commander is a Lieutenant and the Platoon Sergeant a Colour Sergeant or Sergeant; the platoon runs slightly smaller, typically 25 to 30. The Platoon Sergeant's role is to run the platoon's administration, logistics, and discipline so the officer can focus on tactics — a division of labour that repeats at every echelon of the hierarchy.

The platoon is the lowest echelon typically led by a commissioned officer. Below this level, military authority rests entirely with NCOs.

2.3 Company

Three to five platoons plus a company headquarters form a **company** of 80 to 190 soldiers. (The equivalent in armoured and cavalry units is called a **squadron**; in artillery, a **battery**.) Company sizes vary considerably by type: a light infantry company runs around 130 soldiers, an armoured company perhaps 60 — fewer people but more vehicles and organic firepower.

In the US Army the company commander is a Captain (NATO code OF-3), supported by a First Sergeant (OR-8), the senior NCO of the company and the commanding officer's primary advisor on personnel and welfare. In the British Army the same appointment is held by a Major (also OF-3 under NATO coding, though

the rank title differs). This is one of the most persistent sources of cross-national confusion: a British Captain (OF-2) is typically a company second-in-command or adjutant, not a company commander. When a British Major and a US Captain stand at the same command level, they hold the same NATO code despite different national titles.

The company is the primary logistical unit in many armies: it holds organic transport, maintains supplies and ammunition, and cares for its own casualties before evacuation. Below company level, logistics is handled by the echelon above; the squad cannot feed and resupply itself independently.

2.4 Battalion

Three to five companies form a **battalion** of 300 to 1,000 soldiers, commanded by a Lieutenant Colonel (OF-4) and supported by a Command Sergeant Major (OR-9) or Regimental Sergeant Major. The battalion is the primary tactical unit in most Western armies: it is the smallest formation that combines all arms (infantry, organic mortars, reconnaissance elements, and often direct-fire anti-armour weapons) and has a headquarters capable of planning and coordinating multi-company operations over days. It has its own logistics train, medical section, and communications capacity.

The battalion is where NCO authority reaches its institutional ceiling. The Command Sergeant Major is the most senior NCO in the formation and advises the commanding officer on all matters touching on soldiers' welfare, discipline, and training. No NCO commands a battalion; the commanding officer is always a commissioned officer.

		US	NATO	British
Echelon	Personnel	Commander	OF/OR	Commander
Fire Team	4	Corporal / Specialist	OR-4	Corporal
Section / Squad	8-12	Staff Sergeant	OR-6	Corporal
Platoon	26-44	Second Lieutenant	OF-1	Lieutenant

Echelon	Personnel	US Commander	NATO OF/OR	British Commander
Company / Squadron / Battery	80–190	Captain	OF-3	Major
Battalion	300–1,000	Lieutenant Colonel	OF-4	Lieutenant Colonel
Brigade / BCT	1,500–5,000	Colonel	OF-5	Brigadier
Division	10,000–18,000	Major General	OF-7	Major General
Corps	20,000–45,000	Lieutenant General	OF-8	Lieutenant General
Field Army	50,000– 150,000+	General (4-star)	OF-9	General
Army Group	400,000+	General of the Army	OF-10	Field Marshal

3 The Brigade and Above: Operational Echelons

3.1 Brigade

Three or more battalions, augmented with artillery, engineers, logistics, and reconnaissance, form a **brigade** of 1,500 to 5,000 soldiers. The brigade is the lowest echelon that is always **combined arms** — meaning it contains a balanced mix of infantry, armour, fires, and support, and can execute a full tactical mission without external augmentation. Below brigade level, battalions rely on the brigade for artillery, logistics, and specialist capabilities.

In the US Army, the post-2003 modular restructuring created the **Brigade Combat Team (BCT)** as the primary tactical unit. There are three types. The **Infantry Brigade Combat Team (IBCT)** is foot-mobile, designed for complex and urban terrain; it is the lightest and most deployable. The **Stryker Brigade Combat Team (SBCT)** is built around wheeled infantry carrier vehicles, trading armour protection for strategic mobility and speed of deployment. The **Ar-**

moured Brigade Combat Team (ABCT) is the heavy formation, built around main battle tanks and tracked infantry carriers; it has the most firepower and the least strategic mobility. The BCT commander is a Colonel (OF-5). In the British Army and most continental NATO armies a brigade is commanded by a Brigadier or Brigadier General (OF-6).

3.2 Division

Two or more brigades, plus organic aviation, artillery, engineers, and a sustainment brigade, form a **division** of 10,000 to 18,000 soldiers. The division commander is a Major General (two stars, OF-7). A US Army division typically contains three BCTs plus aviation, fires, and sustainment brigades — the support elements are themselves brigade-sized.

The division is the lowest echelon that has its own organic aviation (attack helicopters, reconnaissance aircraft, and transport) and can therefore shape the battlefield beyond the range of its ground fires. It is also the primary echelon at which intelligence fusion occurs: the division has a dedicated intelligence staff capable of synthesising signals, imagery, and human intelligence rather than simply passing information up.

3.3 Corps

Two to five divisions, plus corps-level artillery, air defence, military intelligence, and logistics, form a **corps** of 20,000 to 45,000 soldiers, commanded by a Lieutenant General (three stars, OF-8). The corps is an operational rather than tactical echelon: it does not typically fight directly but coordinates the operations of its divisions across a theatre, synchronises joint fires (including close air support and naval gunfire), manages logistics across multiple lines of communication, and handles the interface with higher command and allied formations.

3.4 Field Army and Army Group

A **field army** of 50,000 to 150,000 or more soldiers groups two or more corps under a four-star General (OF-9). Above this, in large-scale coalition or theatre warfare, two or more field armies are grouped into an **army group**, historically commanded by a General of the Army or Field Marshal (OF-10, five-star) and numbering in the hundreds of thousands. The army group echelon was standard

in both World Wars; today it is rarely activated in peacetime and would represent a wartime coalition command.

3.5 Task Forces and Ad Hoc Formations

Permanent formation tables are the peacetime baseline; war constantly demands improvisation. A **task force** is a temporary formation assembled from elements of different units and arms, designated by its mission or its commander's name. In the Wehrmacht this was the **Kampfgruppe** — a battle group typically named for its commanding officer (Kampfgruppe Peiper, Kampfgruppe von Luck) and assembled from whatever infantry, armour, artillery, and engineers were available. The same principle appears in every modern army: because permanent formations cannot always be resized to fit the tactical problem, commanders assemble what they need from their available assets and give it a temporary designation.

4 Rank Systems: Officers, NCOs, and the Structure of Authority

4.1 The Three Categories

Military personnel divide into three categories with distinct bases of authority and distinct career paths.

Enlisted soldiers are the base of the pyramid. They enter with basic qualifications, receive trade training, and perform tactical duties under direction. Authority accrues through promotion, which reflects demonstrated competence and time served.

Non-commissioned officers (NCOs) are promoted enlisted personnel who have been appointed to leadership roles within the enlisted body. They do not hold a formal commission from the head of state; their authority derives from appointment by their chain of command and seniority within the system. The NCO corps is the institutional layer that translates officer orders into action, maintains day-to-day discipline and standards, trains junior soldiers, and advises officers who lack experience. The French call them *sous-officiers*; the Germans, *Unteroffiziere*. The NCO corps as a formally institutionalised layer of leadership

— with its own career structure, training schools, and doctrinal role — is broadly a development of the 18th- and 19th-century European armies, and its quality is widely regarded as the single best predictor of an army’s tactical effectiveness.

Commissioned officers hold a formal appointment — historically a royal or presidential commission — and enter through an officer academy, university training corps, or officer candidate school, usually after tertiary education. They plan, command, and are legally accountable for their orders in ways that NCOs are not. The commission creates a formal distinction: officers exercise command authority; NCOs exercise supervisory authority delegated within that structure. In most armies the two career paths are nearly impermeable; an NCO who becomes an officer is the exception, not the rule, and the transition is treated as a significant institutional event.

4.2 Rank versus Appointment

Rank is personal and permanent. Appointment is organisational and temporary. A Lieutenant Colonel is always a Lieutenant Colonel; whether they are currently commanding a battalion, serving as a brigade chief of staff, or attending a staff college course is a matter of appointment. These can diverge considerably: in wartime, a colonel might be given a corps to command because no suitable general is available; a general might find themselves commanding a task force the size of a battalion. The rank describes the individual; the echelon describes the job.

4.3 NATO Standardisation: OF and OR Codes

NATO’s STANAG 2116 provides a common reference grid for ranks across member nations. Officers are coded OF-1 (most junior commissioned grade) through OF-10 (five-star, dormant). Other Ranks — enlisted and NCOs combined — are coded OR-1 through OR-9. The codes describe structural position, not national title: a British Major and a US Captain both occupy OF-3 because both command at the same echelon (company), even though their rank titles differ by one notch.

4.4 Comparative Rank Table

The table below maps NATO codes to national titles for three representative armies. Note that titles diverge considerably even when the structural role is

identical.

NATO Code	US Army	British Army	Bundeswehr
OR-1	Private	Private (or Guardsmen / Gunner / Sapper by arm)	Soldat
OR-2	Private Second Class	—	Gefreiter
OR-3	Private First Class	Lance Corporal	Obergefreiter
OR-4	Specialist / Corporal	Corporal	Stabsgefreiter
OR-5	Sergeant	Sergeant	Unteroffizier
OR-6	Staff Sergeant	Staff Sergeant / Colour Sergeant	Feldwebel
OR-7	Sergeant First Class	—	Hauptfeldwebel
OR-8	Master Sergeant / First Sergeant	Warrant Officer Class 2	Stabsfeldwebel
OR-9	Command Sergeant Major / Sergeant Major of the Army	Warrant Officer Class 1	Oberstabsfeldwebel
OF-1	Second Lieutenant / First Lieutenant	Second Lieutenant / Lieutenant	Leutnant / Oberleutnant
OF-2	Captain	Captain	Hauptmann
OF-3	Major	Major	Major
OF-4	Lieutenant Colonel	Lieutenant Colonel	Oberstleutnant
OF-5	Colonel	Colonel	Oberst
OF-6	Brigadier General	Brigadier	Brigadegeneral
OF-7	Major General	Major General	Generalmajor
OF-8	Lieutenant General	Lieutenant General	Generalleutnant

NATO Code	US Army	British Army	Bundeswehr
OF-9	General	General	General
OF-10	General of the Army (dormant)	Field Marshal (effectively honorary)	—

The British OR-8 and OR-9 slots are worth examining. British Warrant Officers Class 1 and 2 (WO1, WO2) occupy these codes, but they are not the same institution as US Army warrant officers. British WOs are senior NCO appointments — the Regimental Sergeant Major (RSM) is a WO1, the Company Sergeant Major (CSM) is a WO2 — and they are the apex of the NCO career path. They hold a warrant from the Defence Council rather than a commission, but they are not technical specialists; they are senior leaders.

4.5 Warrant Officers

The US Army’s warrant officer corps is a distinct structure, filling grades W-1 through W-5. Warrants are technical and tactical experts — helicopter pilots, intelligence analysts, special forces team leaders, cyber operators — who do not follow the standard commissioned officer career path. They have command authority within their specialty but typically do not command manoeuvre formations. A CW5 (Chief Warrant Officer 5) may have decades of mastery in a specific domain that no general officer would have; the warrant structure preserves that expertise outside the promotion-driven churn of the regular officer corps. Germany’s Bundeswehr has no equivalent category; those functions are distributed between NCOs and specialist officers.

4.6 Promotion and the Up-or-Out System

Most modern Western armies use selection boards to decide promotion above a certain point. Below major, promotion is largely time-based and automatic; above major, officers compete for a limited number of slots and are assessed by boards of senior officers. The US Army formalised this under the Defense Officer Personnel Management Act (DOPMA) of 1980: officers not selected for promotion within a defined time window are separated from the service. This “up or out” system is designed to prevent stagnation at mid-grade and to accel-

erate talent to senior positions, but it creates strong incentives for risk-aversion and careerism, which military reformers have criticised since the 1980s.

4.7 Flag Officers and the Senior Grades

Officers above OF-5 (Colonel) enter the flag officer grades, named for the flag or pennant traditionally flown to mark a general's or admiral's headquarters.

OF-6 (one star): Brigadier General in the US Army; Brigadier in the British Army. In the US Army, a one-star is a General officer. In the British Army, a Brigadier is explicitly *not* classified as a General officer by convention — a distinction that surprises most outsiders, since the French Général de brigade and German Brigadegeneral at the same NATO code are classified as general officers in their respective armies. The British Brigadier commands a brigade; the US Brigadier General typically serves as an assistant division commander or in a staff role rather than commanding a brigade.

OF-7 (two stars): Major General; commands a division.

OF-8 (three stars): Lieutenant General; commands a corps or serves as a theatre-level commander.

OF-9 (four stars): General; commands a field army, a geographic combatant command, or serves as Chief of Staff of a service.

OF-10 (five stars): General of the Army (US) or Field Marshal (UK and Commonwealth). The five-star grade was created in the United States in December 1944 primarily to address coalition protocol: when the US Supreme Commander in Europe, Dwight Eisenhower, was promoted to General of the Army, he would outrank British Field Marshals commanding armies under him unless the British also held five-star equivalent rank — which they already did through Montgomery and Alexander. The British Field Marshal grade predates the US General of the Army by centuries. Today, the grade is effectively dormant in both countries; the US has not promoted to five-star since Omar Bradley in 1950, and the British last held active Field Marshals in meaningful operational command during the Second World War. Modern field marshal appointments in the UK are essentially honorary dignities.

Napoleon's Marshals of the Empire (*Maréchaux d'Empire*) deserve a note here. The rank of Maréchal was not a rank in the chain of command but a dignity — an

appointment conferring enormous status and independent command authority. Napoleon created 26 of them between 1804 and 1815. They commanded corps and armies, but the dignity was personal to the individual, not tied to a specific echelon. A Maréchal commanding a corps and a Maréchal commanding three corps were both Maréchaux; the appointment described the person, not the job.

5 The British Regimental Tradition

Nothing confuses readers approaching British military organisation for the first time more reliably than the word “regiment.” In US Army and most continental European usage, a regiment is a tactical formation of several battalions — an operational entity that deploys and fights. In the British Army, an infantry regiment is primarily an administrative, cultural, and ceremonial body: the family to which soldiers belong throughout their careers, the holder of the cap badge, the custodian of battle honours, the manager of a regimental association and museum. The regiment does not deploy to battle as a regiment; its **battalions** do.

This distinction is the single most important thing to understand about the British system.

5.1 Origins and the Cardwell-Childers Reforms

The regimental system dates to the 17th century, when regiments were raised and owned by their colonels under royal commission. The colonel recruited, paid, clothed, and equipped the regiment from a royal allowance; the regiment bore his name. This system was chaotic and expensive, and it produced wide variation in quality and reliability. The first serious rationalisation came with the **Cardwell Reforms of 1872**, which divided Britain into approximately 66 regimental districts aligned with county boundaries. Each district had a depot and two battalions: one serving overseas (garrisoning the empire), one at home recruiting and training, feeding drafts to the overseas battalion. The **Childers Reforms of 1881** formalised this into the linked-battalion county regiment system, giving most regiments geographical names — the Durham Light Infantry, the Worcestershire Regiment, the Seaforth Highlanders — that connected them to a specific recruiting area and community.

This territorial anchoring served two purposes: a practical recruitment pipeline in a volunteer army, and a social bond between soldiers and their home communities that generated fierce regimental loyalty and fighting spirit. The system produced soldiers who identified primarily as members of the Gloucestershire Regiment or the Parachute Regiment rather than as generic members of the British Army.

5.2 The Cap Badge

The cap badge is the outward mark of regimental membership and is taken seriously in a way that outsiders frequently underestimate. Every regiment has a unique badge — often incorporating county heraldry, a royal cypher, or a commemorative device from a specific battle — worn on the beret or service dress cap. Transferring between regiments is culturally unusual and was historically uncommon. The badge is worn throughout a soldier's career; it marks the regiment as the primary unit of institutional identity in a way that has no parallel in most other armies.

5.3 Modern Amalgamations and Large Regiments

Post-war defence reductions forced successive rounds of amalgamation. Regiments that had maintained separate identities through two world wars were merged, producing hyphenated names that reflected often painful consolidations (the Duke of Edinburgh's Royal Regiment, the Royal Anglian Regiment). The most recent wave under the Future Army Structure reorganisation created **large regiments**: multi-battalion administrative bodies that retain distinct battalion identities. The **Rifles** — the largest infantry regiment in the British Army — absorbed the Devon and Dorsets, the Light Infantry, the Royal Green Jackets, and the Royal Gloucestershire, Berkshire and Wiltshire Regiment. Soldiers serve in 1 Rifles, 4 Rifles, or 5 Rifles, but the cap badge and administrative home are The Rifles.

5.4 The Armoured Exception

In the Royal Armoured Corps, the regiment is the tactical unit, not a parent administrative body. An armoured regiment of roughly 550 soldiers and 58 main battle tanks is the equivalent of an infantry battalion; it deploys and fights as a regiment, commanded by a Lieutenant Colonel. This reflects the different

tactical geometry of armoured warfare, where a regiment-sized formation of tanks is the primary manoeuvre element, not a company-sized one.

5.5 Functional Corps

The British Army also uses “corps” in a functional rather than echelon sense. The Royal Artillery, Royal Engineers, Royal Corps of Signals, Royal Electrical and Mechanical Engineers (REME), and Adjutant General’s Corps are all “corps” — not tactical corps in the sense of two or three divisions, but institutional homes for soldiers in specialist trades. A gunner belongs to the Royal Artillery regardless of which battery or regiment he is currently serving in. This use of “corps” to mean “branch of service” is distinct from the echelon corps (a formation of divisions) and has caused centuries of confusion when British officers speak to American counterparts.

6 The Napoleonic Inheritance: How Modern Structure Was Invented

6.1 The Pre-Napoleonic Army

Before the Revolutionary Wars, European armies had no permanent formation between the regiment and the army. Regiments were the highest persistent tactical and administrative units; everything above them — divisions, columns, wings — was assembled ad hoc for a specific campaign and dissolved when it ended. More important, regiments were strictly branch-specific: infantry regiments had no cavalry, cavalry regiments had no infantry, and artillery was collected in separate park commands. No formation below the army itself contained all three combat arms.

This imposed a decisive constraint on strategy. An army could not divide into independent formations because any detachment that separated from the main body was unbalanced: if it had only infantry, it could not screen, pursue, or reconnoitre; if it had only cavalry, it could not hold ground. The army moved as a single mass along a single route, limited in speed by the slowest element, in strategic reach by the need to stay together, and in deception by the impossibility of advancing on multiple axes simultaneously.

French theorists had identified this problem in the decades before the Revolution. Maurice de Saxe argued for permanent combined-arms formations in his 1757 *Mes Rêveries*. Marshal Broglie experimented with temporary divisions during the Seven Years' War. The theorist Guibert, in his *Essai général de Tactique* (1772), advocated formations capable of operating independently. Jean de Bourcet theorised dispersed marching and rapid concentration. Napoleon read and re-read all of them. But the ideas were conceptual; no army had institutionalised them.

6.2 The Corps d'Armée

Napoleon permanently organised the French army into corps d'armée in 1800, and the design solved the pre-Napoleonic problem directly. Each corps contained infantry divisions, a cavalry formation for screening and reconnaissance, a reserve of heavier artillery beyond what the divisions carried, engineer detachments, and a logistics train capable of sustaining the corps independently for days. Because any corps contained all three combat arms in organic assignment, it could engage and hold an enemy force while the rest of the army converged — which was, in essence, the operational method Napoleon used in every major campaign.

The practical working size of a corps was 20,000 to 30,000 soldiers, though Napoleon adjusted this widely by circumstance. Davout commanded 27,000 at Jena-Auerstedt in 1806 and defeated a Prussian force twice his size by holding until the broader engagement resolved. The self-sufficiency of the corps meant that the Grande Armée could march on multiple axes, each corps a day's march from the next — what Napoleon called the *bataillon carré* (square battalion), a loose formation of four corps arranged so that any two were within supporting distance of any threatened point. No army that marched as a single mass could match this for speed, strategic reach, or deception.

6.3 Spread and Legacy

The defeats of the War of the Fourth Coalition (1806–07) forced Prussia to adopt the corps system almost immediately. The reformers Scharnhorst and Gneisenau, working under the restrictions of the Treaty of Tilsit, restructured the Prussian army on Napoleonic lines; by 1813 the army that fought at Leipzig used permanent corps and divisions. Austria reformed after the catastrophic defeats of 1805 and 1809. Russia organised its forces into corps by the 1812 campaign. Even Britain, which never adopted the permanent peacetime corps, used Wellington’s divisions in the Peninsular War as the primary combined-arms manoeuvre element.

The structural legacy is direct and traceable. The modern US Army corps, commanded by a Lieutenant General and containing multiple divisions with organic artillery, engineers, and logistics, is the same functional architecture that Napoleon codified in 1800 and that Davout demonstrated at Jena. Two centuries of incremental reform have changed the weapons, the vehicles, the communications, and the doctrine, but the basic answer to the span-of-control and combined-arms problems has not changed.

7 Twentieth-Century Adaptation: Three Organizational Revolutions

The Napoleonic inheritance — company to battalion to regiment to division to corps — survived into the 20th century largely intact. The industrial era introduced three innovations that modified but did not replace it.

7.1 Stormtroopers and Mission Command

The Western Front shattered the assumption that mass infantry assaults could break through fixed defences. Massed formations attacking across a broad front generated catastrophic losses for negligible gain; the problem was not courage but geometry. Machine guns, barbed wire, and pre-registered artillery fire turned any predictable, massed approach into a killing ground.

The German response was systematic and doctrinal. From 1915 onward, specialist assault units — *Stosstruppen* (stormtroopers) — developed new methods

under officers like Captain Willy Ernst Rohr of Sturmbataillon Rohr. Rather than attacking in waves across the entire front, small groups of ten to twenty specialists — armed with grenades, pistols, light machine guns, flamethrowers, and light mortars — probed for weak points, bypassed strongpoints, and drove deep into the enemy rear, leaving isolated resistance for follow-on forces. The underlying principle was **infiltration**: find the gaps, exploit them fast, let momentum carry the attack forward before the defender can respond.

This required a fundamental change in how orders were given. Prescriptive orders — “advance at H-hour, cross the wire at this point, turn left at this landmark” — are useless to a small unit that has already bypassed the wire and is now 500 metres into the enemy position. Instead, orders stated the objective and allocated resources, then trusted subordinate leaders to find their own way. The Germans formalised this as *Auftragstaktik* — mission tactics — and it became the doctrine of the Reichswehr and then the Wehrmacht. A German junior officer or senior NCO was expected to act on initiative whenever the situation departed from the plan, without waiting for orders, so long as he kept the mission objective in mind. The contrast with the prescriptive, synchronised approach of most Allied armies in both world wars was stark, and it gave German formations at every echelon a speed of response that partially compensated for chronic material disadvantages.

7.2 The Panzer Division and Combined Arms at Scale

The second revolution was the **Panzer division**, which applied the combined-arms principle to mechanised warfare and proved, in the campaigns of 1939 and 1940, that speed and concentration could shatter armies before they could respond.

A fully equipped Panzer division contained a tank regiment of roughly 300 vehicles, two or more motorised infantry regiments, organic artillery capable of moving with the armour, anti-tank and anti-aircraft elements, an engineer battalion for obstacle breaching, a signals battalion, and a full logistics train. This was the first time all arms had been permanently integrated at division level and fully motorised — able to advance not at the pace of a walking infantryman (25 kilometres per day at best) but at the pace of wheeled and tracked vehicles (100 kilometres per day in good conditions). At Sedan in May 1940 Guderian's XIX Corps covered 240 kilometres in four days, a strategic movement that the

French had designed their entire defensive plan to make impossible.

Alongside the Panzer division, the Wehrmacht routinely employed the **Kampfgruppe** — an ad hoc battle group, usually named for its commander, assembled from whatever assets were available for a specific task. A Kampfgruppe might contain two tank companies, a motorised infantry battalion, a battery of self-propelled artillery, and a platoon of engineers: enough to be combined-arms capable without the full overhead of a division. The Kampfgruppe institutionalised tactical flexibility and allowed the Germans to concentrate force rapidly without waiting for formal orders restructuring the permanent chain of command.

7.3 Soviet Deep Battle

The third revolution was conceptual rather than purely technological. Soviet theorists in the late 1920s and 1930s — most notably Mikhail Tukhachevsky and Vladimir Triandafillov — developed the doctrine of **deep battle** (*gluboki boy*): simultaneous attacks across the full depth of the enemy's position, from front-line trenches to operational reserves to command nodes and supply lines, designed to paralyse the enemy's ability to respond rather than simply pushing back his forward line.

Deep battle required a specific organisational answer: forces had to be echeloned so that a breakthrough echelon penetrated the forward defence, an exploitation echelon (typically mechanised or armoured) poured through the gap before the enemy could close it, and a reserve echelon exploited further to prevent consolidation. This was not the Napoleonic sequential battle — breakthrough, then pursuit — but a near-simultaneous attack on multiple echelons of depth. The doctrine was formalised in the Field Regulations of 1936 (PU-36), then suppressed when Tukhachevsky was executed in Stalin's purge of the military in 1937, then rediscovered from necessity after the catastrophic losses of 1941.

Operation Bagration in June–August 1944 was the largest demonstration of deep battle at operational scale in military history. Four Soviet fronts (army groups) attacked Army Group Centre simultaneously on a 600-kilometre front. Mechanised and tank armies poured through the initial penetrations, encircling formations before they could withdraw, destroying Army Group Centre as a coherent force in six weeks. The Germans lost approximately 300,000 killed or captured; the Red Army advanced up to 600 kilometres. The operation was enabled by

the Soviet organisational structure — multiple echelons of armoured and mechanised corps, managed through a front-level command that could coordinate operations across enormous distances — and by the Stavka (Soviet high command) reserve system that maintained fresh forces throughout.

The legacy of deep battle is direct in NATO doctrine. AirLand Battle, the US Army’s warfighting concept formalised in the 1982 and 1986 editions of FM 100-5, explicitly drew on Soviet deep battle theory to argue for simultaneous attacks against the enemy’s rear areas, disrupting reinforcement and supply before the ground battle was decided on the forward line. The modern concept of multi-domain operations descends from the same intellectual tradition.

8 Naval and Air Force Equivalents

8.1 The Navy: Rank Translation and Task Organisation

Naval rank titles are entirely different from army titles, though they occupy the same NATO pay grades. The most persistent source of confusion is the word “captain”: a naval Captain (O-6) is the equivalent of a Colonel, not an army Captain. Conversely, a naval Lieutenant (O-3) equals an army Captain. The table below shows the full officer equivalence.

Pay Grade	US Navy	US Army Equivalent
O-1	Ensign	Second Lieutenant
O-2	Lieutenant (Junior Grade)	First Lieutenant
O-3	Lieutenant	Captain
O-4	Lieutenant Commander	Major
O-5	Commander	Lieutenant Colonel
O-6	Captain	Colonel
O-7	Rear Admiral (Lower Half)	Brigadier General
O-8	Rear Admiral (Upper Half)	Major General
O-9	Vice Admiral	Lieutenant General
O-10	Admiral	General
O-11	Fleet Admiral (wartime only)	General of the Army

Below the fleet level, naval formations are assembled by mission rather than

permanent establishment, using the **task organisation** system. A **fleet** — commanded by a Vice Admiral — generates **task forces** (designated TF, commanded by CTF), which divide into **task groups** (TG, CTG) and **task units** (TU, CTU). Numbering is hierarchical and decimal: Task Unit 62.5.3 is the third unit in the fifth group of Task Force 62, itself under the Sixth Fleet. The system is deliberately flexible: a fleet can re-designate forces, split task forces, and reassign ships to new groups within hours.

The **Carrier Strike Group (CSG)** is the primary modern operational naval formation. It typically comprises an aircraft carrier with an embarked air wing of 65 to 70 aircraft, one or two Ticonderoga-class guided missile cruisers, two to three Arleigh Burke-class guided missile destroyers, an attack submarine screening ahead, and a supply ship. A CSG is a self-contained combined-arms formation in naval terms: organic air power, surface fires, subsurface capability, and its own logistics.

8.2 The Air Force: Squadron to Major Command

The US Air Force hierarchy from bottom to top: **flight** (the smallest element, typically 4–24 aircraft), **squadron** (18–24 aircraft, the primary tactical unit, commanded by a Lieutenant Colonel), **group** (two or more squadrons, Colonel), **wing** (two or more groups, the primary base-level command, Brigadier General or Colonel), **numbered air force** (two or more wings, Major General or Lieutenant General), **major command (MAJCOM)** (Lieutenant General or General).

The RAF uses a distinctive rank terminology that confuses those familiar with army equivalents:

RAF Rank	Army Equivalent
Pilot Officer	Second Lieutenant
Flying Officer	Lieutenant
Flight Lieutenant	Captain
Squadron Leader	Major
Wing Commander	Lieutenant Colonel
Group Captain	Colonel
Air Commodore	Brigadier
Air Vice Marshal	Major General

RAF Rank	Army Equivalent
Air Marshal	Lieutenant General
Air Chief Marshal	General
Marshal of the Royal Air Force	Field Marshal

8.3 The “Squadron” Problem

The word “squadron” is used in three entirely different senses across the armed forces, and confusing them is easy. In the navy, a squadron is a grouping of three to seven ships of a similar type (a destroyer squadron). In the air force, a squadron is the primary flying unit of 18 to 24 aircraft, the air force equivalent of an infantry company or battalion. In the army, a squadron is the armoured or cavalry equivalent of a company — typically 60 to 100 soldiers and 14 to 20 vehicles. All three uses are current and in regular use; context is the only guide.

8.4 The Marine Air-Ground Task Force

The US Marine Corps answers the combined-arms question differently from the army. Rather than achieving combined arms at brigade or division level by attaching aviation from a separate air force command, the Marines organise into **Marine Air-Ground Task Forces (MAGTFs)**, which integrate ground combat, aviation, and logistics under a single command by design.

A MAGTF has three permanent elements: a Ground Combat Element (infantry, armour, artillery), an Aviation Combat Element (fixed-wing and rotary aircraft organic to the force), and a Combat Logistics Element. The standard deployable MAGTF is the **Marine Expeditionary Unit (MEU)** of roughly 2,200 Marines with 6 to 8 helicopters and 6 fixed-wing aircraft, routinely deployed aboard a three-ship amphibious ready group. Above this sits the **Marine Expeditionary Brigade (MEB)** for mid-scale operations and the **Marine Expeditionary Force (MEF)**, a full combined-arms force of 50,000 or more, for major operations.

The MAGTF model gives a combatant commander a self-contained expeditionary capability without the coordination overhead of synchronising army ground forces with an independent air force — at the cost of maintaining a dedicated aviation arm within the Marine Corps itself.

9 NATO Interoperability: Shared Standards and Persistent Friction

NATO is a military alliance of over thirty nations with armies, navies, and air forces built on different national traditions, equipment fleets, and doctrinal schools. Making them work together in a crisis requires a framework of shared standards, and NATO has built an extensive one. Over 1,200 Standardisation Agreements (STANAGs) cover everything from rank equivalence (STANAG 2116) to tactical symbology (APP-6, the standard for marking unit positions on maps) to ammunition calibres, fuel specifications, radio protocols, and medical evacuation procedures.

The **Enhanced Forward Presence (EFP)**, established in 2017 and significantly reinforced following Russia's full-scale invasion of Ukraine in 2022, provides a practical test case for how interoperability works in practice. Multinational battlegroups of approximately 1,000 to 2,000 soldiers are deployed in Estonia, Latvia, Lithuania, and Poland, each commanded by a framework nation (the UK in Estonia, Canada in Latvia, Germany in Lithuania, the US in Poland) with contributing nations providing company- and platoon-sized elements. These battlegroups must plan, train, and be able to fight together despite having different radios, different command vocabularies, different rules of engagement inherited from national law, and different tactical cultures.

The experience of EFP has clarified where standardisation genuinely works and where it has limits. Tactical symbology is broadly standardised and effective; staff officers from different nations can read each other's maps. Fuel is partially standardised for NATO vehicles. But encrypted radio interoperability remains patchy; nations using national cryptographic systems cannot always communicate directly with allies without going through liaison elements. Command philosophy differs substantially: the US Army's mission command doctrine, which devolves considerable authority to junior leaders to exercise initiative, sits uneasily alongside armies with more directive traditions in which detailed orders from above are the norm. And mixing units from different nations within a single company — as opposed to national companies within a multinational battalion — multiplies the coordination problem sharply enough that it is generally avoided below battalion level.

The EFP battlegroups would, in a major war, serve as a tripwire and an im-

mediate reinforcement cadre rather than a self-sufficient fighting force. They are large enough to trigger Article 5 if attacked but not large enough to conduct extended combined-arms combat independently. Reinforcement from pre-positioned equipment stocks and rapid-deployment forces would be required within days; the logistical and procedural challenge of integrating those reinforcements with the existing battlegroups under a coherent multinational corps command remains one of the principal practical problems that NATO headquarters exercises are designed to rehearse.

10 Further Reading

The literature on military organisation is extensive. The following works are starting points for each of the major themes in this primer.

Military history and structure generally: John Keegan, *The Face of Battle* (1976) — the canonical account of what battle actually looks like from the soldier's perspective, with implications throughout for why organisation matters. Martin van Creveld, *Supplying War* (1977) — how logistics determines the organisational limits of military formations. Trevor Dupuy, *A Genius for War* (1977) — quantitative analysis of German military effectiveness, relevant to Auftragstaktik.

The Napoleonic system: David Chandler, *The Campaigns of Napoleon* (1966) — the standard reference for Napoleonic operational art, including the corps system in action. Rory Muir, *Tactics and the Experience of Battle in the Age of Napoleon* (1998) — how the structure translated into combat.

20th-century organisation: Robert Citino, *The German Way of War* (2005) — the doctrine of *Bewegungskrieg* (war of manoeuvre) and its organisational roots. Richard Overly, *Why the Allies Won* (1995) — the Soviet deep battle and industrial capacity case. Williamson Murray and Allan Millett (eds), *Military Innovation in the Interwar Period* (1996) — how the Panzer division and other innovations were developed between the wars.

Modern US Army structure: Department of the Army, *FM 3-0: Operations* (2022 edition) — the current statement of US Army doctrine, freely available online. The Army's BCT structure is described in detail in *FM 3-96: Brigade*

Combat Team (2021).

Ranks and the British system: David Fraser, *And We Shall Shock Them: The British Army in the Second World War* (1983) — the regimental system under pressure. Allan Mallinson, *The Making of the British Army* (2009) — accessible historical survey from Marlborough to the present.
